b) Passing a negative message length

c) Passing a very large message length

d) Passing an invalid value for the message length

e) Passing a message length that is longer than the buffer size

f) Passing a message length that is shorter than the buffer size

2.6 Producing safe output

In addition to validating all inputs, an API should also take care to ensure that the outputs it produces are well-formed and cannot be abused. Unfortunately, the code you've written so far does not take care of these details. Let's have a look again at the output you just produced:

```
HTTP/1.1 400 Bad Request
Date: Fri, 01 Feb 2019 15:21:16 GMT
Content-Type: text/html;charset=utf-8
Transfer-Encoding: chunked
Server: Jetty(9.4.8.v20171121)
{"error": "java.lang.IllegalArgumentException: invalid
username: a really long username that is more than 30
characters long"}
```

There are three separate problems with this output as it stands:
