Appendix A Setting up Java and Maven

This chapter covers

- Installing Java 11
- Setting up Maven
- Installing Docker
- Installing an OAuth2 Authorization Server
- Installing an LDAP directory

The source code examples in this book require several pre-requisites to be installed and configured before they can be run. This appendix describes how to install and configure those pre-requisites. The following software is required:

- Java 11
- Maven 3

A.1 Java and Maven

A.1.1 Mac OS X

On Mac OS X, the simplest way to install the pre-requisites is using Homebrew (https://brew.sh). Homebrew is a package manager that simplifies installing other software on Mac OS X. To install Homebrew, open a Terminal window
