```
kubectl version --client --short
```

You should see output like the following:

```
Client Version: v1.16.3
```

If kubectl can't be found, then make sure that /usr/local/bin is in your PATH by running

```
export PATH=$PATH:/usr/local/bin
```

You should then be able to use kubectl.

## B.2 Linux

Although Linux is the native environment for Kubernetes, it's still recommended to install minikube using a virtual machine for maximum compatibility. For testing, I've used VirtualBox on Linux too, so that is the recommended option.

### B.2.1 VirtualBox

VirtualBox for Linux can be installed by following the instructions for your Linux distribution at https://www.virtualbox.org/wiki/Linux_Downloads.

### B.2.2 Minikube
