Some of the most interesting results in this area focus on complete and complete bipartite graphs: Guy's and Zarankiewicz' conjectures postulate a formula for the crossing number of these graphs, but they haven't been proved so far.

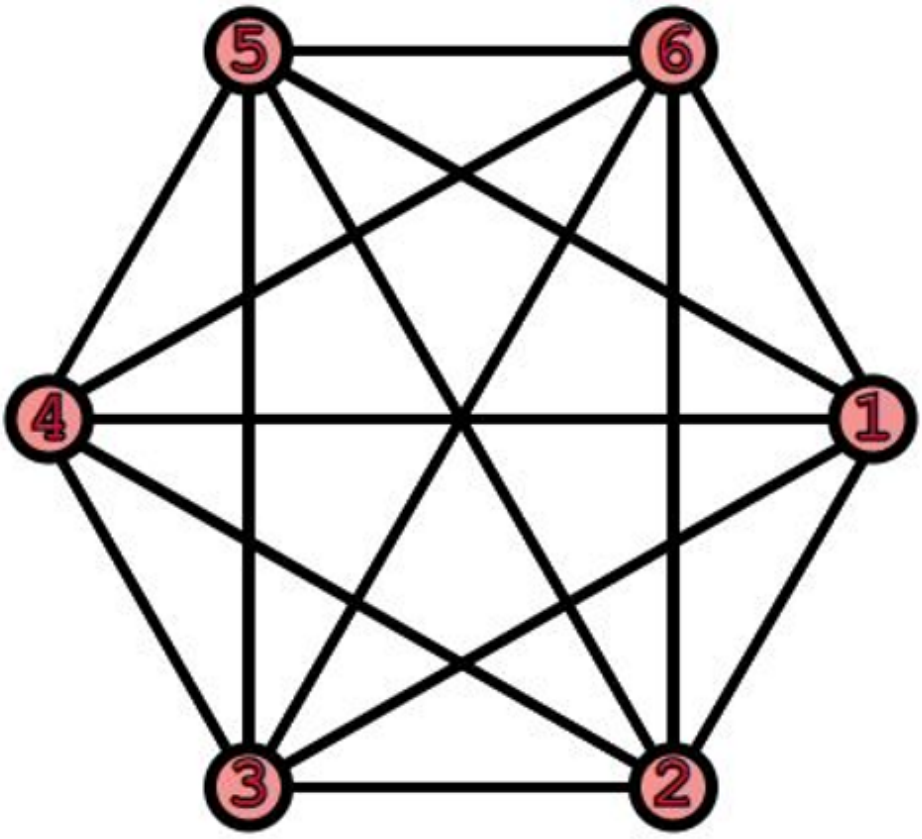

Figure 15.12 A naïve embedding for K_6: there are 15 crossing pair of edges with this layout.

Guy's conjecture hypothesizes that the minimum crossing number of the generic complete graph with n vertices is given by:
