

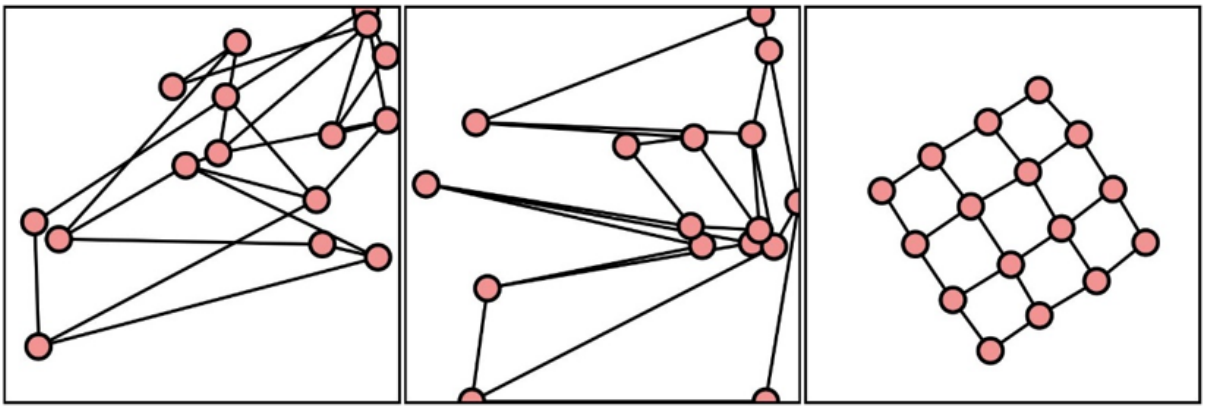

Figure 17.17 The square mesh graph with 16 vertices embedded by: random sampling (left), minimum crossing simulated annealing (center), Davidson and Harel's algorithm (right).

Listing 17.4 shows an implementation of the full cost function (with all 5 components), although the examples shown were run without the edge-vertex distance term.

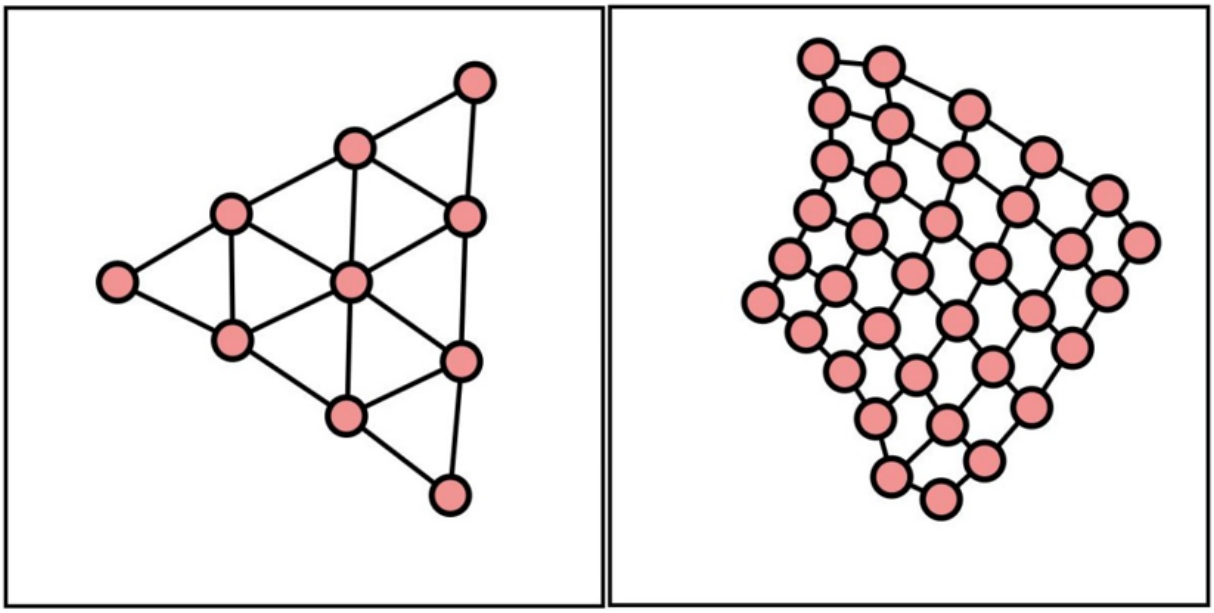

Figure 17.18 The triangular graph with 4 vertices per side and the square mesh graph with 36 vertices
