[1] In the general case, we can compare two expressions composing both variables and values.

[2] Another less mathematically precise alternative could have been assigning **`inf`** (which stands for infinity) to `y`: but since the sign of the limit depends on the direction we approach `0`, we neither `+inf` nor `-inf` would be correct.

[3] An alias is just another name for a variable: it can be implemented by creating a new variable or just a reference to the original one.
