```
  return n + g(n-1);                                #1
}

function g(n) {
  if (n < 0) {
    return 1;
  } else if (n === 0) {
    return 2;
  } else {
    return n * f(n/3);
                                                  #2
  }
}
```

#1 Function `f` calls `g`
#2 And function `g` calls `f` back

As you can see, function `f` never calls itself directly, and likewise `g`.

However, check out the call stack for `f(7)`:

- `f(7)`
- `g(6)`
- `f(2)`
- `g(1)`
- `f(0.3333)`
- `g(-0.6666)`

Needless to say, mutual recursion is even trickier.
