- *Precision* answer the question "what percent of calls to `contains` returning true were correct?".
- *Recall* answer the question "among all calls to `contains` on elements actually contained in the filter, what percent of them returned true?". (This one, as we know, will always be 100% for Bloom filters).

[1] If the threshold is guaranteed to be a integer or rational number, we can also guarantee that the solution will be in the same computational class as the solution to the decision problem.

[2] See *Grokking Algorithms*, chapter 4, page 51

[3] For instance, a dataset where one of the classes is rare or difficult to get data for: this is often the case in medicine with rare diseases.
