So, when we have a *cache miss*, trying to access an element that is not on the cache, we just add a new entry to the front of our linked list.

Listing 7.2 LRU Cache set

```
function LRUCache::set(key,
value)                                                  #1
  if hashTable.contains(key)
then                                                   #2
    node ← hashTable.get(key)
                                      #3

node.setValue(value)
            #4
    elements.moveToFront(node)
                  #5
    return false
                #6
  elsif getSize() >= maxSize then
                #7
    evictOneEntry()
                                                 #8
  newNode = elements.addFront(key, value)
                                    #9
  hashTable.set(key, newNode)
                                                 #10
  if elementsTail == null then
                                                 #11
    elementsTail ← newNode
  return true
                #12
```

#1 Declare method `set`. The prefix `LRUCache::` is just a notation to remind that this function is a method of class `LRUCache`.
