For composite data structures like caches, we need to be twice as careful, as we need to make sure that also the basic data structures upon which it's built are *thread-safe*[27].

And thus, for LFU, we need to ensure that both the priority queue and the hash table support concurrent execution.

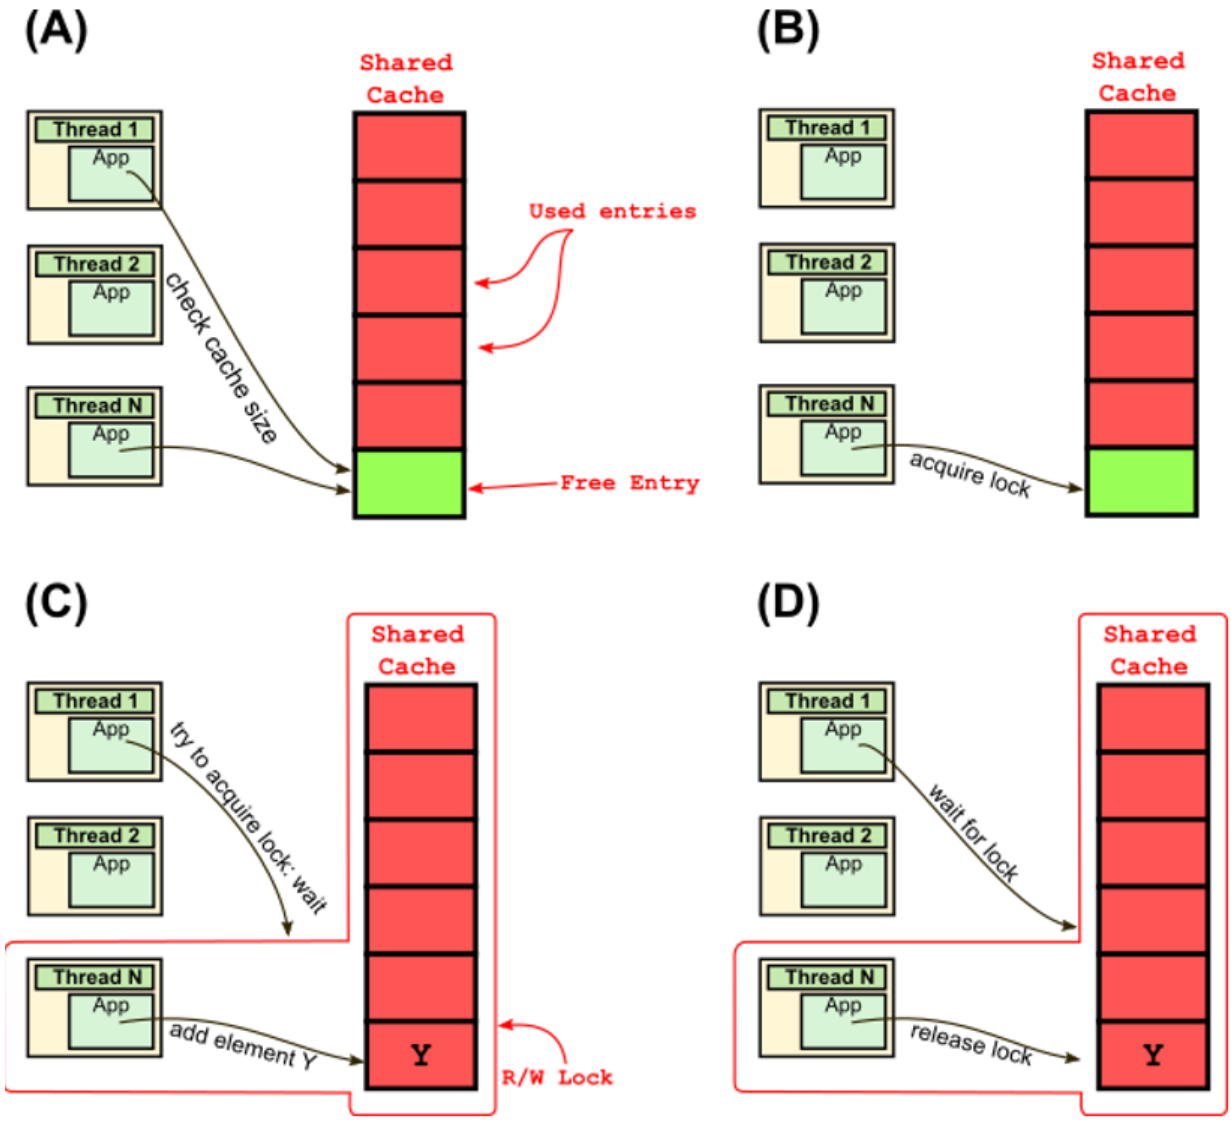

Figure 7.13 Using a synchronized implementation for the cache, we can avoid race conditions. In the example shown in figure 7.12, a synchronized data
