

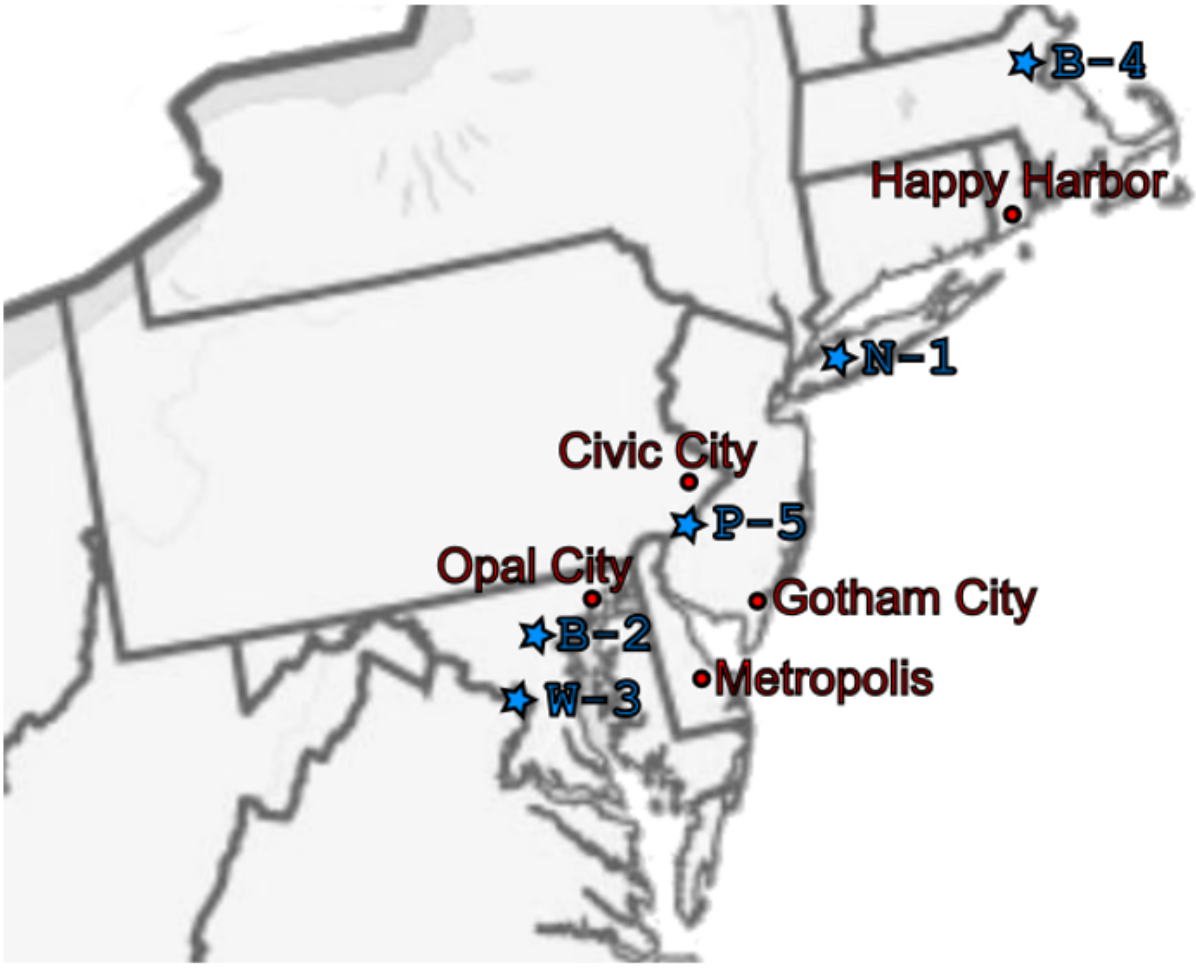

Figure 9.1 Our example map, showing cities (real and imaginaries) and warehouses (all imaginary!) on the East coast. In a typical application for k-d trees, given a point on the map, we would like to find the closest warehouse, or the closest city, to that point.

· Viable solutions, however, do exist: in this chapter we will first explain the issues we face in moving to multi-dimensional spaces, then in this and next chapter we will delve into a few alternatives to efficiently tackle those challenges.
