CLI from your computer, you use access keys to authenticate as the `mycli` user.

You're using the AWS account root user at the moment to log in to the Management Console. You should create an IAM user instead, for the following reasons:

- Creating IAM users allows you to set up a unique user for every person who needs to access your AWS account.
- You can grant access only to the resources each user needs, allowing you to follow the least-privilege principle.

To make things easier if you want to add users in the future, you'll first create a group for all users with administrator access. Groups can't be used to authenticate, but they centralize authorization. So, if you want to stop your admin users from terminating EC2 instances, you need to change the identity policy only for the group instead of changing it for all admin users. A user can be a member of zero, one, or multiple groups.

It's easy to create groups and users with the CLI, as shown here. Replace `$Password` in the following with a secure password:

```
$ aws iam create-group --group-name "admin"
$ aws iam attach-group-policy --group-name "admin" \
➥ --policy-arn "arn:aws:iam::aws:policy/AdministratorAccess"
$ aws iam create-user --user-name "myuser"
$ aws iam add-user-to-group --group-name "admin" --user-name "myuser"
$ aws iam create-login-profile --user-name "myuser" --password '$Password'
```

The user `myuser` is ready to be used. But you must use a different URL to access the Management Console if you aren't using the AWS account root user: https:/ /$accountId .signin.aws.amazon.com/console. Replace `$accountId` with the
