Summary

- AWS Lambda allows you to run your C#/.NET Core, Go, Java, JavaScript/ Node.js, Python and Ruby code within a fully managed, highly available, and scalable environment.
- The Management Console and blueprints offered by AWS help you to get started quickly.
- By using a schedule expression, you can trigger a Lambda function periodically. This is comparable to triggering a script with the help of a cron job.
- CloudWatch is the place to go when it comes to monitoring and debugging your Lambda functions.
- The Serverless Application Model (SAM) enables you to deploy a Lambda function in an automated way with AWS CloudFormation.
- Many event sources exist for using Lambda functions in an event-driven way. For example, you can subscribe to events triggered by CloudTrail for every request you send to the AWS API.
- The most important limitation of a Lambda function is the maximum duration of 900 seconds per invocation.
- AWS Lambda can be used to built complex services as well, from typical web applications, to data analytics, and IoT backends.
