compares your folder with the /backup folder in your S3 bucket and uploads only new or changed files:

```
$ aws s3 sync $path s3://awsinaction-$yourname/backup
```

Your command should look similar to this one:

```
$ aws s3 sync /Users/andreas/Desktop s3://awsinaction-awittig/backup
```

Depending on the size of your folder and the speed of your internet connection, the upload can take some time.

After uploading your folder to your S3 bucket to back it up, you can test the restore process. Execute the following command in your terminal, replacing `$path` with a folder you'd like to use for the restore (don't use the folder you backed up) and `$yourname` with your name. Your Downloads folder would be a good place to test the restore process:

```
$ aws s3 cp --recursive s3://awsinaction-$yourname/backup $path
```

Your command should look similar to this one:

```
$ aws s3 cp --recursive s3://awsinaction-awittig/backup/ \
➥ /Users/andreas/Downloads/restore
```

Again, depending on the size of your folder and the bandwidth of your internet connection, the download may take a while.

## Versioning for objects

By default, S3 versioning is disabled for every bucket. Suppose you use the following steps to upload two objects:

1. Add an object with key A and data 1.
2. Add an object with key A and data 2.

If you download the object with key A, you'll download data 2. The old data 1 doesn't exist any more.
