```
$ aws rds describe-db-instances --query "DBInstances[0].Endpoint"
```

Run the following command on the VM to import the data from the file wordpress-import.sql into the RDS database instance; replace `$DBAddress` with the `Address` you printed to the terminal with the previous command. The `Address` will look similar to `wdtq7tf5caejft.cd0o57zo3ohr.us-east-1.rds.amazonaws.com`. Also, type in `wordpress` when asked for a password:

```
$ mysql --host $DBAddress --user wordpress -p < wordpress-import.sql
```

Point your browser to the WordPress blog again, and you'll now find many new posts and comments there. If you don't remember the URL, run the following command on your local machine to fetch it again:

```
$ aws cloudformation describe-stacks --stack-name wordpress \
➥ --query "Stacks[0].Outputs[0].OutputValue" --output text
```
