second with `ReadCapacityUnits=5`, you can make five strongly consistent `getItem` requests for that table if the item size isn't larger than 4 KB per second. If you make more requests than are provisioned, DynamoDB will first throttle your request. If you make many more requests than are provisioned, DynamoDB will reject your requests.

Increasing the provisioned throughput is possible whenever you like, but you can only decrease the throughput of a table four to 23 times a day (a day in UTC time). Therefore, you might need to overprovision the throughput of a table during some times of the day.

Limits for decreasing the throughput capacity

Decreasing the throughput capacity of a table is generally allowed only four times a day (a day in UTC time). Additionally, decreasing the throughout capacity is possible even if you have used up all four decreases if the last decrease has happened more than an hour ago.

It is possible but not necessary to update the provisioned capacity manually. By using Application Auto Scaling, you can increase or decrease the capacity of your table or global secondary indices based on a CloudWatch metric automatically. See http://mng.bz/lR7M to learn more.
