

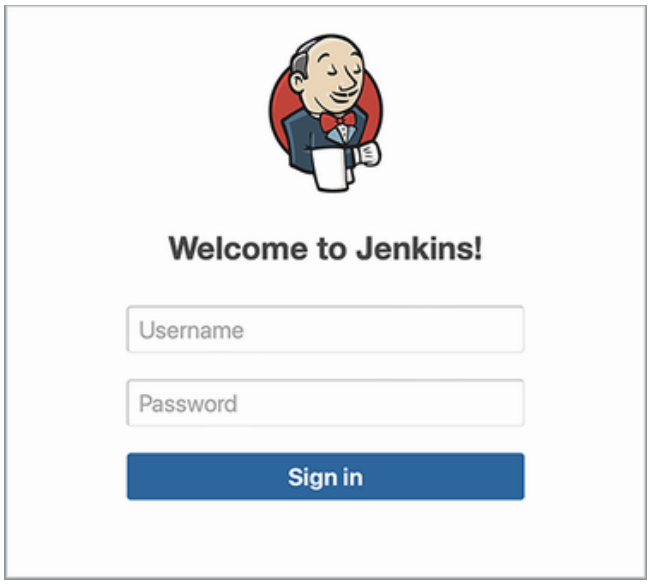

Figure 13.1 The web interface of the Jenkins server

The following steps guide you through the process of creating a Jenkins project:

1. Open http://$PublicIP:8080 in your browser, and replace `$PublicIP` with the public IP address from the output of the previous `describe` command.
2. Log in with user `admin` and the password you chose when starting the CloudFormation template.
3. Select the Install Suggested Plugins option.
4. Keep the default for Jenkins URL and click Save and Finish.
5. Click Start Using Jenkins.
6. Click New Item to create a new project.
7. Type in AWS in Action as the name for the new project.
8. Select Freestyle Project as the job type, and click OK.

The Jenkins server runs on a virtual machine with automated recovery. If the virtual machine fails because of problems with the host system, it will be recovered with all data and the same public IP address. The URL doesn't change because you're using an Elastic IP for the virtual machine. All data is restored because the new virtual machine uses the same EBS volume as the previous virtual machine, so you can find your AWS in Action job again.
