storage services like RDS, EFS, S3, and DynamoDB can help you to do so. See part 3 if you need help with using these services.

13.3.2 AWS services come with different high availability guarantees

It is important to note that some AWS services are highly available or even fault-tolerant by default. Other services provide building blocks to achieve a highly available architecture. As described next, you can use multiple availability zones or even multiple regions to build a highly available architecture, as figure 13.9 shows:

- Route 53 (DNS) and CloudFront (CDN) operate globally over multiple regions and are highly available by default.
- S3 (object store), EFS (network filesystem) and DynamoDB (NoSQL database) use multiple availability zones within a region so they can withstand a data center outage.
- The Relational Database Service (RDS) offers the ability to deploy a primary-standby setup, called Multi-AZ deployment, so you can fail over into another availability zone with a short downtime, if necessary.
- A virtual machine runs in a single availability zone. AWS offers a tool to build an architecture based on EC2 instances that can fail over into another availability zone: autoscaling.
