balancer. Only the load balancer is accessible, and it forwards requests to the backend servers behind it. The network traffic to load balancers and backend EC2 instances is controlled by security groups, which you learned about in chapter 5.

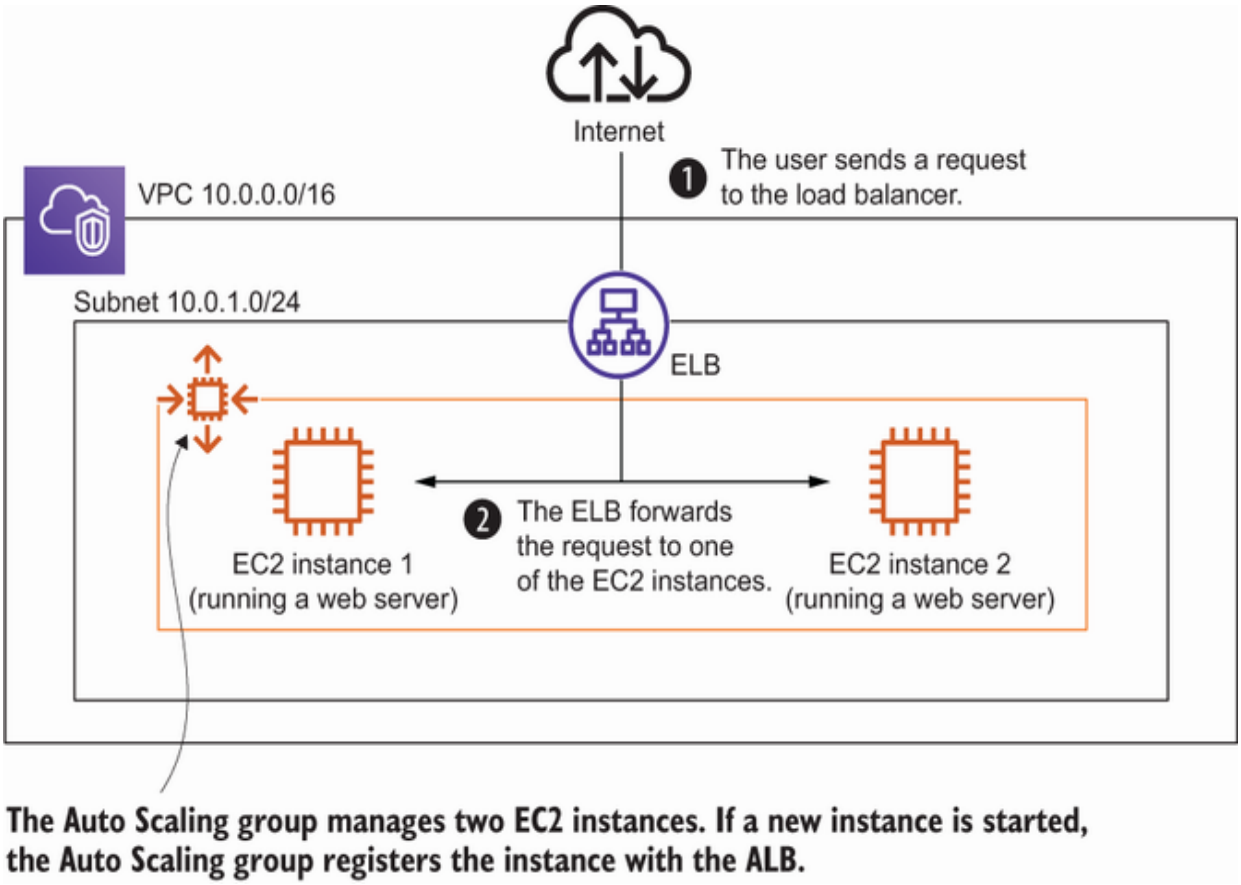

Figure 14.2 The load balancer evaluates rules so it can forward incoming rules to a specific target group.

If the Auto Scaling group adds or removes EC2 instances, it will also register new EC2 instances at the load balancer's target group and deregister EC2 instances that have been removed.

An ALB consists of the following three required parts and one optional part:
