```
# [...]
LoadBalancerSecurityGroup:
  Type: 'AWS::EC2::SecurityGroup'
  Properties:
    GroupDescription: 'alb-sg'
    VpcId: !Ref VPC
    SecurityGroupIngress:
    - CidrIp: '0.0.0.0/0'
      FromPort: 80                          ①
      IpProtocol: tcp
      ToPort: 80
LoadBalancer:
  Type: 'AWS::ElasticLoadBalancingV2::LoadBalancer'
  Properties:
    Scheme: 'internet-facing'               ②
    SecurityGroups:
    - !Ref LoadBalancerSecurityGroup        ③
    Subnets:                                ④
    - !Ref SubnetA
    - !Ref SubnetB
    Type: application
  DependsOn: 'VPCGatewayAttachment'
```

① Only traffic on port 80 from the internet will reach the load balancer.

② The ALB is publicly accessible (use internal instead of internet-facing to define a load balancer reachable only from a private network).

③ Assigns the security group to the load balancer

④ Attaches the ALB to the subnets

The second listing configures the load balancer to listen on port 80 for incoming HTTP requests. It also creates a target group. The default action of the listener forwards all incoming requests to the target group.

Listing 14.2 Creating a load balancer and connecting it to an Auto Scaling group B

```
Listener:
  Type: 'AWS::ElasticLoadBalancingV2::Listener'
  Properties:
    DefaultActions:                         ①
    - TargetGroupArn: !Ref TargetGroup
```
