You'll now implement each of these steps to change a URL into a PNG.

To receive a message from an SQS queue, you must specify the following:

- `QueueUrl`—The unique queue identifier.
- `MaxNumberOfMessages`—The maximum number of messages you want to receive (from one to 10). To get higher throughput, you can get messages in a batch. We usually set this to 10 for best performance and lowest overhead.
- `VisibilityTimeout`—The number of seconds you want to remove this message from the queue to process it. Within that time, you must delete the message, or it will be delivered back to the queue. We usually set this to the average processing time multiplied by four.
- `WaitTimeSeconds`—The maximum number of seconds you want to wait to receive messages if they're not immediately available. Receiving messages from SQS is done by polling the queue. AWS allows long polling, for a maximum of 20 seconds. When using long polling, you will not get an immediate response from the AWS API if no messages are available. If a new message arrives within 10 seconds, the HTTP response will be sent to you. After 20 seconds, you also get an empty response.

The following listing shows how this is done with the SDK.

Listing 14.5 worker.js: Receiving a message from the queue

```
const fs = require('fs');
const AWS = require('aws-sdk');
const puppeteer = require('puppeteer');
const config = require('./config.json');
```
