In many cases, processing at least once is a good tradeoff. Check your requirements before using SQS if this tradeoff fits your needs.

SQS doesn't guarantee the message order

Messages may be consumed in a different order than that in which you produced them. If you need a strict order, you should search for something else. If you need a stable message order, you'll have difficulty finding a solution that scales like SQS. Our advice is to change the design of your system so you no longer need the stable order, or put the messages in order on the client side.

SQS FIFO (first in, first out) queues

FIFO queues guarantee the order of messages and have a mechanism to detect duplicate messages. If you need a strict message order, they are worth a look. The disadvantages are higher pricing and a limitation of 3,000 operations per second. Check out the documentation at http://mng.bz/xM7Y for more information.

SQS doesn't replace a message broker

SQS isn't a message broker like ActiveMQ—SQS is only a message queue. Don't expect features like message routing or message priorities. Comparing SQS to ActiveMQ is like comparing DynamoDB to MySQL.

Amazon MQ
