Now you are ready to deploy Etherpad. Use the following command to create a deployment. Don't forget to replace `$BucketName` with the name of your artifact bucket:

```
aws deploy create-deployment --application-name etherpad-codedeploy \
➥ --deployment-group-name etherpad-codedeploy \
➥ --revision "revisionType=S3,
➥ s3Location={bucket=$BucketName,
➥ key=etherpad-lite-1.8.17.zip,bundleType=zip}"
```

Use the AWS Management Console or the following command to check whether the deployment succeeded. Replace `$DeploymentId` with the deployment ID printed to the console from the previous command:

```
$ aws deploy get-deployment --deployment-id $DeploymentId
```

Reload or open the URL of your Etherpad application and create a new pad. Click the settings icon to check the current version of Etherpad. The version is `c85ab49`, which is the latest Git commit ID for version 1.8.17.

Next, imagine you want to update to version 1.8.18 of Etherpad to roll out a fix for a security problem. The first step is to upload the revision. Don't forget to replace `$BucketName` with the name of your artifact bucket:

```
$ aws s3 cp chapter15/etherpad-lite-1.8.18.zip \
➥ s3://$BucketName/etherpad-lite-1.8.18.zip
```

Afterward, create another deployment to roll out version 1.8.18 with the following command:
