a legacy system as well as to build something from scratch. In recent years, there has hardly been a technology that has spread as rapidly as containers. In our experience, containers fit well for both brownfield and greenfield projects. You will learn how to use containers to deploy your workloads on AWS in this chapter.

We want to focus on the cutting-edge aspects of deploying containers on AWS. Therefore, we skip the details on how to create container images or start a container with Docker. We recommend *Docker in Action* (Manning, 2019; https://www.manning.com/books/docker-in-action-second-edition) if you want to learn about the fundamentals of Docker and containers.

## Examples not covered by Free Tier

The examples in this chapter are not covered by the Free Tier. Deploying the examples to AWS will cost you less than $1 per day. You will find information on how to delete all resources at the end of each example or at the end of the chapter. Therefore, we recommend you complete the chapter within a few days.
