https://aws.amazon.com/apprunner/pricing/ for more details.

By the way, don't forget to delete your App Runner service to avoid unexpected costs. Replace `$ServiceArn` with the ARN you noted after creating the service, as shown here.

Listing 18.3 Fetching information about App Runner services

```
$ aws apprunner delete-service \
➥ --service-arn $ServiceArn
```

That was fun, wasn't it? But simplicity comes with limitations. Here are two reasons App Runner might not be a good fit to deploy your application:

- App Runner does not come with an SLA yet.
- Also, comparing costs between the different options is tricky, because different dimensions are used for billing. Roughly speaking, App Runner should be cheap for small workloads with few requests but rather expensive for large workloads with many requests.

That's why we will introduce two other ways to deploy containers on AWS next. The two main services to manage containers on AWS are Elastic Container Service (ECS) and Elastic Kubernetes Services (EKS).

WHAT IS KUBERNETES? Kubernetes (K8s) is an open source container orchestration system. Originally, Google developed Kubernetes, but nowadays, the Cloud Native Computing Foundation maintains the project. Kubernetes can run on your local machine and on-premises, and most cloud providers offer a fully managed service.
