There will likely be occasions when you want some of your content pages to be able to optionally provide additional HTML-based content to be rendered as part of the layout. Figure 3.5 shows the previous layout with a different widget: Things to Do. You can imagine this widget containing additional information about attractions of interest at the vacation location you are currently viewing—for example, visiting the Eiffel Tower if you chose Paris as a destination. This widget is included in the layout area, which is common to all pages, but it will only appear when a destination has been selected, and its content will depend on the selected destination.

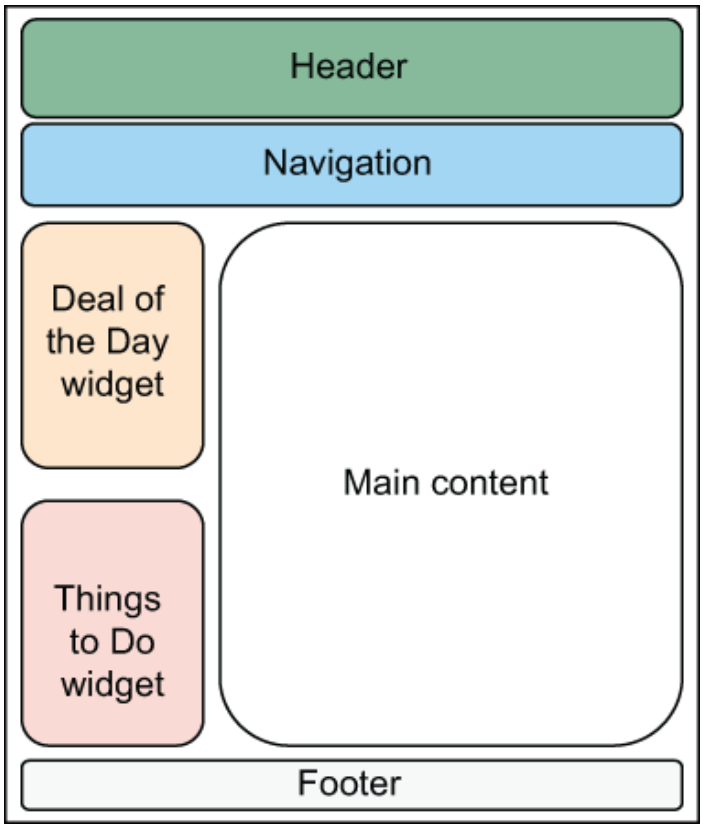

Figure 3.5 The Things to Do widget represents page-specific content that is positioned within the layout.

Razor includes sections that enable this scenario, defined using the `@section` directive within the content page. The following listing shows a section named `ThingsToDoWidget` being defined along with some HTML content.
