Listing 3.20 Using `IsSectionDefined` to determine if the calling page defined a section

```
<div class="card alert-danger p-5 border-5 mt-2">
@if (IsSectionDefined("ThingsToDoWidget"))
{
    @await RenderSectionAsync("ThingsToDoWidget")
}
else
{
    <p>Things To Do Widget default content</p>
}
</div>
```

If a content page defines a section, it must be handled within the layout page, usually with a call to `RenderSectionAsync`. However, you might have conditions when you don't want to render the content of a section. In those cases, you can use the `IgnoreSection` method to prevent rendering.

Listing 3.21 Using `IgnoreSection` to prevent the rendering of section content

```
@if(!IsAdmin)
{
    IgnoreSection(“admin”);
}
else
{
    @await RenderSectionAsync(“admin”)
}
```

Note that the `IgnoreSection` method returns `void`, so it is not prefixed with the @ symbol and must be terminated with a semicolon.

3.3 Reusable HTML with partial views, tag helpers, and view components

Layouts are one way of achieving reusable HTML. You define the site layout in one place, and it is used by all pages referencing the layout. ASP.NET Core provides other Razor-based mechanisms for working with reusable HTML: partial
