

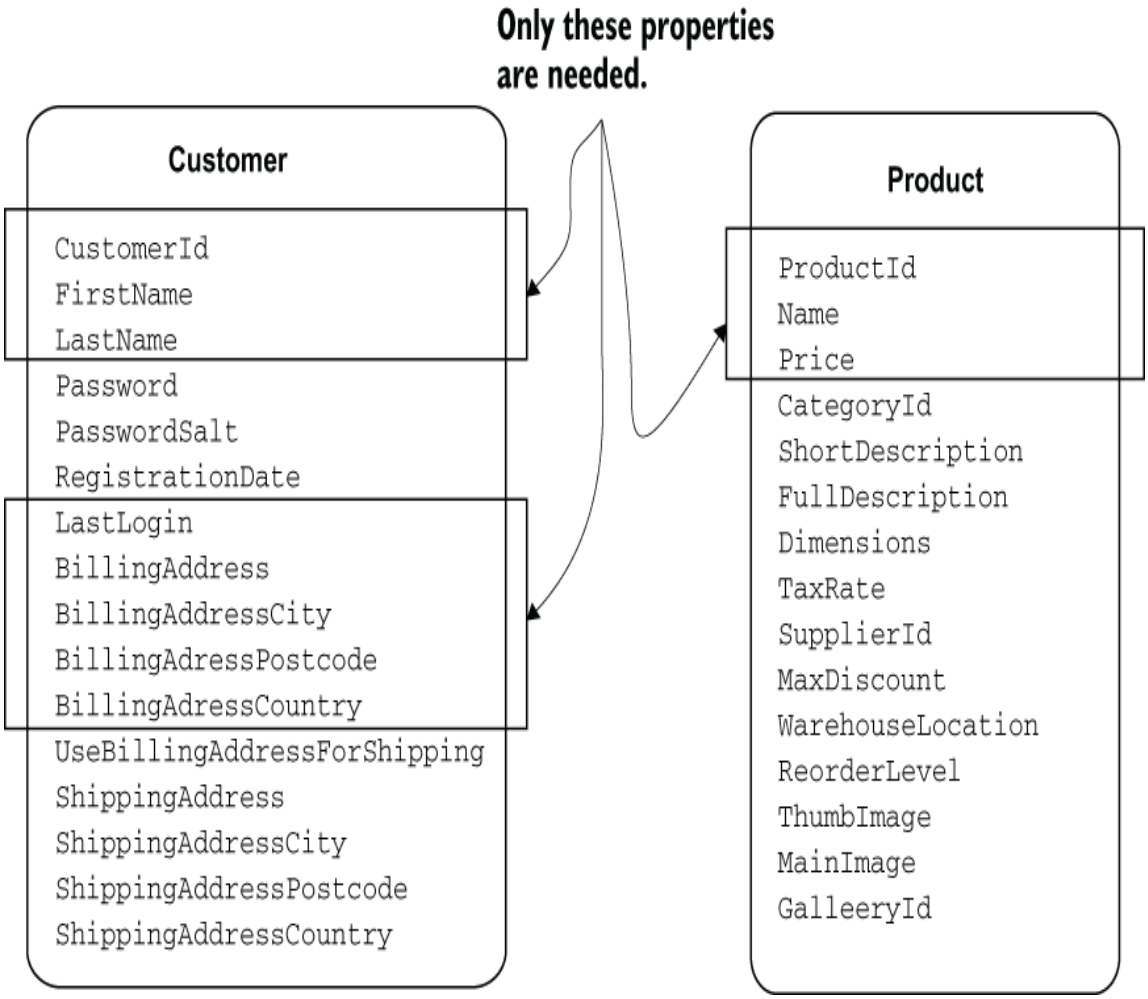

Figure 3.8 Only the outlined columns or properties are required by the order summary view

Listing 3.24 An example view model class

```
public class OrderSummaryViewModel
{
    public int CustomerId { get; set; }
    public string CustomerName { get; set; }
    public string BillingAddress { get; set; }
    public bool UseBillingForShipping { get; set; }
    public int ProductId
    public string Name { get; set; }
    public decimal Price { get; set; }
}
```

And there you have it: a view model—a container for only the data required for a view. View models are used extensively by developers who work with the MVC
