```
        <input name="email" />
        <button>Register</button>
    </form>
    <p>@Model.Message</p>                                    ❸
</div>
```

❶ The name part of handler methods is assigned to the page-handler attribute of the form tag helper.

❷ The input name attribute matches the parameter name on the targeted handler method.

❸ The value of Message is rendered to the browser.

Figure 3.12 shows what happens when the page is rendered and the user searches for *Razor Pages*. The form tag helper appends the name of the handler to the query string using the key `handler`:

```
?handler=Search
```
