- Variables and expressions are rendered to the output when they are prefixed with `@`.
- Control blocks can be embedded within the markup section of a Razor file by prefixing them with `@`.
- Razor HTML encodes all output it renders for security reasons.
- You can use `Html.Raw` to disable HTML encoding.
- Layout pages are used to eliminate duplication of common content across multiple pages.
- Tag helpers target specific tags and automate the generation of HTML.
- The `PageModel` is a combined view model and controller.
- The `@model` directive makes the `PageModel` available to the Razor page.
- The `Model` property of the Razor page provides access to `PageModel` properties.
- Handler methods within `PageModels` are responsible for processing requests. They target specific HTTP methods and can return `void`, `Task`, or an `IActionResult`.
- Handler method parameters can get their values from query strings parameters that have the same name.
- Named handler methods allow you to specify multiple handlers for the same HTTP method.
