subsequent chapters, we will continue with this scenario and start building an application that offers vacation packages in cities worldwide (we call them *city breaks* in the UK). If you would like to try the code samples featured in this and the following chapters, you should create a new Razor Pages application based on the instructions from chapter 2 and name it CityBreaks.

4.1 Routing basics

Routing is not part of the Razor Pages framework. It comes as separate components and, as such, is plugged into your application as middleware. The two key components that control routing in a Razor Pages application are the `EndpointRouting` middleware and the `Endpoint` middleware, illustrated in figure 4.1. They are added to the application pipeline via the `UseRouting` and `MapRazorPages` methods, respectively. Listing 4.1 shows the relevant lines of code in the `Program` class as a reminder.
