This will replace the default route template. The routes that get generated as a result of this change are shown in table 4.4.

Table 4.4 Using literal text in a route template to override default route generation

Page	Route template
\Pages\Privacy\Index.cshtml	`"Privacy\Index"`
\Pages\Privacy\Index.cshtml	`"Privacy"`
\Pages\Privacy.cshtml	`"privacy-policy"`

You can consider route templates as behaving the same way as URLs, in that those that do not begin with the path separator are relative to the current page, whereas those that start with the path separator are absolute and not appended to the current page's route.

4.2.2 Route parameters

We saw at how the URL https://domain.com/city/london might map to a single file named london.cshtml located within a folder named City. Instead of representing a filename, *london* could represent data. In Razor Pages, data passed in the URL is known as *route data* and is represented in route templates by *route parameters*. The city is no longer a folder; it is a page that processes the incoming data. Parameters are added to route templates by specifying their name in curly braces { }. The name itself can be more or less anything, except the following reserved words:

- Action
- Area
- Controller
