Within the `Apply` method, you can access the existing `SelectorModel` objects and amend the value of the `Template` property to change the existing templates, or you can add `SelectorModel` objects to the `Selectors` collection to add additional route templates. The following listing shows a `PageRouteModelConvention` that copies the existing route templates, inserts an optional route parameter called `culture` as the first segment, and then adds the copy to a new `SelectorModel` for every page that is discovered in the application.

Listing 4.8 Creating a `PageRouteModelConvention` to add a custom route convention

```
using Microsoft.AspNetCore.Mvc.ApplicationModels;                          ❶

namespace CityBreaks.PageRouteModelConventions
{
    public class CultureTemplatePageRouteModelConvention :
    ➥ IPageRouteModelConvention                                           ❷
    {
        public void Apply(PageRouteModel model)                            ❸
        {
            var selectorCount = model.Selectors.Count;

            for (var i = 0; i < selectorCount; i++)                        ❹
            {
                var selector = model.Selectors[i];

                model.Selectors.Add(new SelectorModel                      ❺
                {
                    AttributeRouteModel = new AttributeRouteModel
                    {
                        Order = 100,                                       ❻
                        Template =                                         ❻
                        ➥ AttributeRouteModel.CombineTtemplates("{culture?}",❻
                        ➥ selector.AttributeRouteModel.Template)          ❻
                    }
                });
            }
        }
```
