4.3.2 Using the IUrlHelper to generate URLs

The anchor tag helper is used to generate URLs for internal links, but sometimes, you need to generate URLs that will be used for other purposes. You might need to generate a URL that will be included in an email—like the one that you are often required to click to validate your registration on a website, for example. Or you might need to generate a URL in an `img` tag on a Razor page. The `IUrlHelper` service can be used for this. It is made available to you in Razor Pages through the `Url` property of the `PageModel` class and the Razor page itself.

The `Url` property has a number of methods, two of which are of particular interest within a Razor Pages application: the `Page` method and the `PageLink` method. The `Page` method offers a number of versions or overloads that generate relative URLs as strings from the name of the page passed in to it, along with the name of a page handler method and route values. Other overloads can be used to generate absolute URLs. The `PageLink` method generates absolute URLs based on the current request. The following example shows how to use the `Page` method to generate a relative URL that includes route data, which is passed in to the `Page` method as an anonymous type, where the property names match route parameter names.

Listing 4.9 Generating a relative URL with the `IUrlHelper`

```
public class IndexModel : PageModel
{
    public void OnGet()
    {
        var target = Url.Page("City", new { cityName = "Berlin", rating = 4 });
    }
}
```
