- Route templates represent the endpoint to be matched. They consist of literals, separators, and parameters, which represent data in URLs.
- Routes are generated from the location of the Razor page on the disk.
- You can customize individual page routes by providing a new template to the `@page` directive.
- You can use route constraints to disambiguate between similar route patterns.
- You can add additional routes to a page using `AddPageRoute`.
- Alternatively, you can create your own `PageRouteModelConvention` to customize routing for multiple pages.
- The anchor tag helper generates outgoing URLs based on the routing system, as does the `IUrlHelper`.
- The `RouteOptions` object provides some ways to customize the URL generation process.
- You can use parameter transformers to take full control over the URL generation process.
