```
    <ul>
    @foreach (var country in Model.Countries)
    {
        <li>
            <img src="/images/flags/@(country.CountryCode).png" />
            @country.CountryName
        </li>
    }
    </ul>
}
```

❶ The collection of input models is iterated.

❷ The hidden field is created to hold the explicit index value for each item. The Id property value is assigned to it.

❸ CountryName and CountryCode inputs are created, with their index value also set to the Id property of the current element. Their current values are assigned to the value attribute on the respective input control.

Run the application, and navigate to /country-manager/edit. You should see the data rendered within the form fields (figure 5.10).

Figure 5.10 The bound values are rendered to the input controls.

Make the modifications to the second entry, and press Update. Not only have the revised values been rendered with their flags in a list, but they have been
