

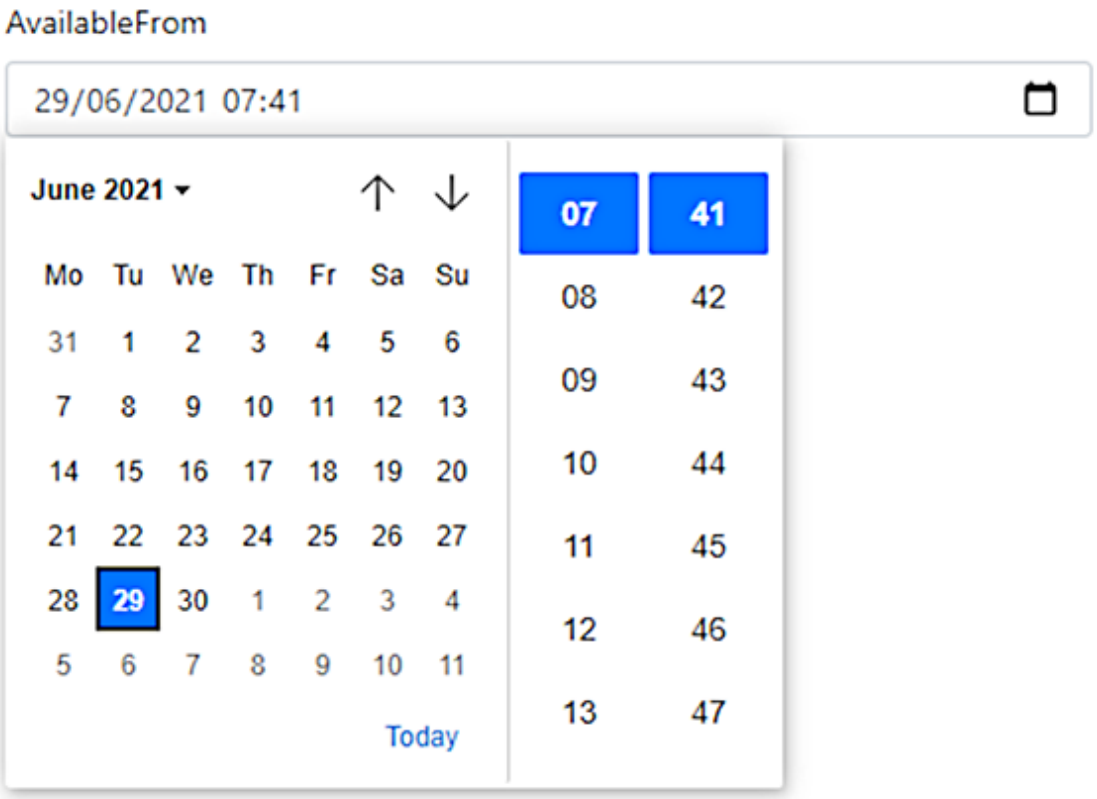

Figure 6.4 The seconds and milliseconds part of the time are no longer available to be set.

Supported date and time formats

The date- and time-based input types mostly support values formatted according to the rules specified within RFC 3339 (https://datatracker.ietf.org/doc/html/rfc3339). In brief, they require the year to be expressed as four digits and the date and time components to be ordered from the least specific (i.e., the year) to the most specific. The time portion should be separated from the date by an uppercase T. Within .NET, the following format string represents this:

```
yyyy-MM-ddTHH:mm:ss.fff
```

The seconds (`ss`) and milliseconds (`fff`) are optional for most browsers if you include the time element.
