You should also add a `using` directive to include the `Microsoft.AspNetCore.Mvc .Rendering` namespace, which is where the `SelectList` type resides. Now make the changes detailed in the next listing to the markup part of the Create.cshtml.cs file located in the PropertyManager folder. The changes will include a select tag helper that presents a range of cities for the user to choose from, and when the form is submitted, the name of the selected city will be rendered to the page.

Listing 6.8 Amending the form to include a select tag helper

```
@if (Request.HasFormContentType)                                    ❶
{                                                                   ❶
    <p>You selected @Model.SelectedCity</p>                         ❶
}                                                                   ❶
<form method="post">
    <div class="mb-3">                                              ❷
        <label class="form-label" asp-for="SelectedCity"></label>   ❷
        <select class="form-control" asp-for="SelectedCity"         ❷
         ➥ asp-items="Model.Cities"></select>                      ❷
    </div>                                                          ❷
    <div class="mb-3">
        <label class="form-label" asp-for="Name"></label>
        <input class="form-control" asp-for="Name" />
    </div>
    <div class="mb-3">
        <label class="form-label" asp-for="MaxNumberOfGuests"></label>
        <input class="form-control" asp-for="MaxNumberOfGuests" />
    </div>
    <div class="mb-3">
        <label class="form-label" asp-for="DayRate"></label>
        <input class="form-control" asp-for="DayRate" />
    </div>
    <div class="mb-3">
        <label class="form-label" asp-for="AvailableFrom"></label>
        <input class="form-control" asp-for="AvailableFrom" />
    </div>
    <div class="mb-3">
        <label asp-for="SmokingPermitted"></label>
        <input asp-for="SmokingPermitted" />
    </div>
    <button class="btn btn-primary">Submit</button>
</form>
```
