Now replace the existing content in Index.cshtml with the simple form shown in the next listing, which contains just the select tag helper and a button.

Listing 6.15 Adding the form to the home page

```
<div class="col-4">
    <form method="post">
        <div class="mb-3">
            <label class="form-label" asp-for="SelectedCities"></label>
            <select class="form-control" asp-for="SelectedCities"
             ➥ asp-items="Model.Cities"></select>
        </div>

        <div class="mb-3">
            <button class="btn btn-primary">Submit</button>
        </div>
    </form>
</div>
<p>@Model.Message</p>
```

When you run the application, it is immediately apparent that the output of the `select` tag helper is different from previous examples because you should see the list box appear. Select a couple of options while holding down the Ctrl key, and submit the form. Confirm that your selections have been included in the `Message` output and that they remain selected in the list box (figure 6.11).
