

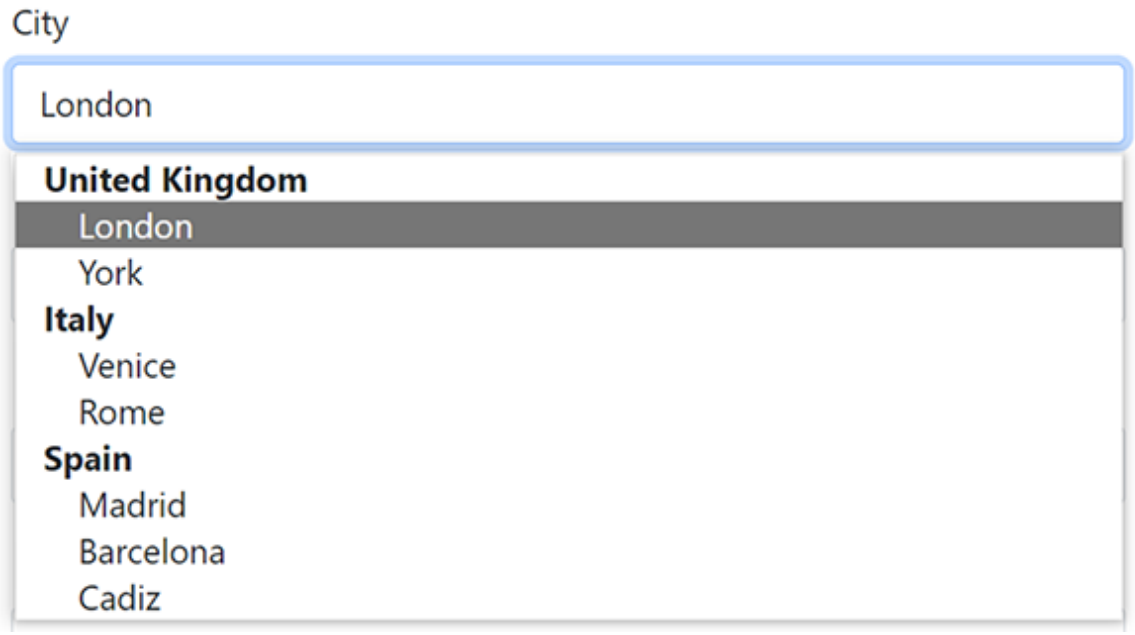

Figure 6.12 The cities are grouped by country.

Listing 6.17 Replacing the `CountryName` property with a `Country` property

```
public class City
{
    public int Id { get; set; }
    public string Name { get; set; }
    public Country Country { get; set; }     ❶
}
```

❶ Replace the string property with a Country property.

The next listing shows a revised version of the `GetCityOptions` method, where the country name is set through the `Country` property.

Listing 6.18 Using composition to set the country for each city

```
private SelectList GetCityOptions()
{
    var cities = new List<City>
    {
        new City{ Id = 1, Name = "London", Country = new Country{
                  ➥ CountryName = "United Kingdom"} },
```
