leaving the mysteries of implementing low- level specialist tasks like encryption and hashing to experts who know what they are doing.

These examples touch on a couple of features provided by web development frameworks. (figure 1.2). But the list doesn’t stop there. Think of any common repetitive task that developing a web application might require of you: processing an incoming request for data, mapping URLs that don’t include a file extension, communicating with databases, processing and validating form submissions, working with files, sending emails. All of these tasks are made easier when using a framework that incorporates these features. And by the time you have finished this book, you will be able to use Razor Pages to accomplish all of these tasks easily.
