Recall from the previous chapter that you will need to add a `Required` attribute if you make the property nullable, but you still want to make the associated form control a mandatory field.

The actual values presented to the user could do with a little tidying up. If you have worked with enumerations before, you might be tempted to apply the `Description` attribute to each member that you want to be more user friendly. However, that will not affect the select tag helper. Just like other form-related tag helpers, the select tag helper responds to the `DisplayAttribute`. The following listing demonstrates how to apply that to each member for which you want something other than the raw property name to be presented to the user.

Listing 6.22 Using the `DisplayAttribute` to change the value presented

```
public enum Rating
{
    Unrated,
    [Display(Name="1 Star")]
    OneStar,
    [Display(Name = "2 Star")]
    TwoStar,
    [Display(Name = "3 Star")]
    ThreeStar,
    [Display(Name = "4 Star")]
    FourStar,
    [Display(Name = "5 Star")]
    FiveStar
}
```

The rendered result is shown in figure 6.14.
