- Options can be provided as a collection of `SelectListItem`s or as a `SelectList`.
- You can set the selected item by assigning a value to the property bound to the `for` attribute on a select tag helper.
- You can enable multiple selections by binding the select tag helper to a collection property.
- The `SelectList` supports the use of option groups.
- You can use the `Html.GetEnumSelectList` method to bind an enumeration to a select tag helper.
- When you use the input tag helper to generate a check box, binding a Boolean property to it generates a hidden field with its value set to `false`.
- Radio controls must have their type specified explicitly.
- File uploading requires `multipart/form-data` encoding to work.
- Uploaded files must be posted, and they must be bound to an `IFormFile` type.
