```
        private readonly LifetimeDemoService _lifetimeDemoService;
        public LifetimeDemoModel(LifetimeDemoService lifetimeDemoService)
        {
            _lifetimeDemoService = lifetimeDemoService;
        }

        public Guid Value { get; set; }
        public void OnGet()
        {
            Value = _lifetimeDemoService.Value;
        }
    }
}
```

Change the code in the Razor page itself by adding the highlighted lines from the following listing.

Listing 7.8 The `LifetimeDemo` Razor page

```
@page
@model CityBreaks.Pages.LifetimeDemoModel
@{
    ViewData["Title"] = "Lifetime demo";
}
<h2>Service Lifetime Demo</h2>
<p>The Singleton service returned @Model.Value</p>
```

Run the application, navigate to /lifetime-demo (remembering the effect of the `KebabPageRouteParameterTransformer`), and note the value rendered to the browser. Refresh the page, and confirm the value stays the same. Use a different browser to request the page. The value doesn't change. This is because the value was set when the service was first instantiated, and as a singleton, the same instance of the service is shared by all consumers across all requests.

TRANSIENT SERVICES

Services registered with the `AddTransient` method are given a transient lifetime, meaning they are created each time they are resolved.
