specifications within your application code and provide those to EF Core. Your LINQ queries are translated into SQL commands by EF Core, which executes them against the database, as illustrated in figure 8.2. The SQL EF core generates is parameterized, meaning it is protected against potential *SQL injection* attacks (http://mng.bz/49qj). You will study SQL injection attacks in more detail in chapter 13 when you focus on securing your application against external threats.

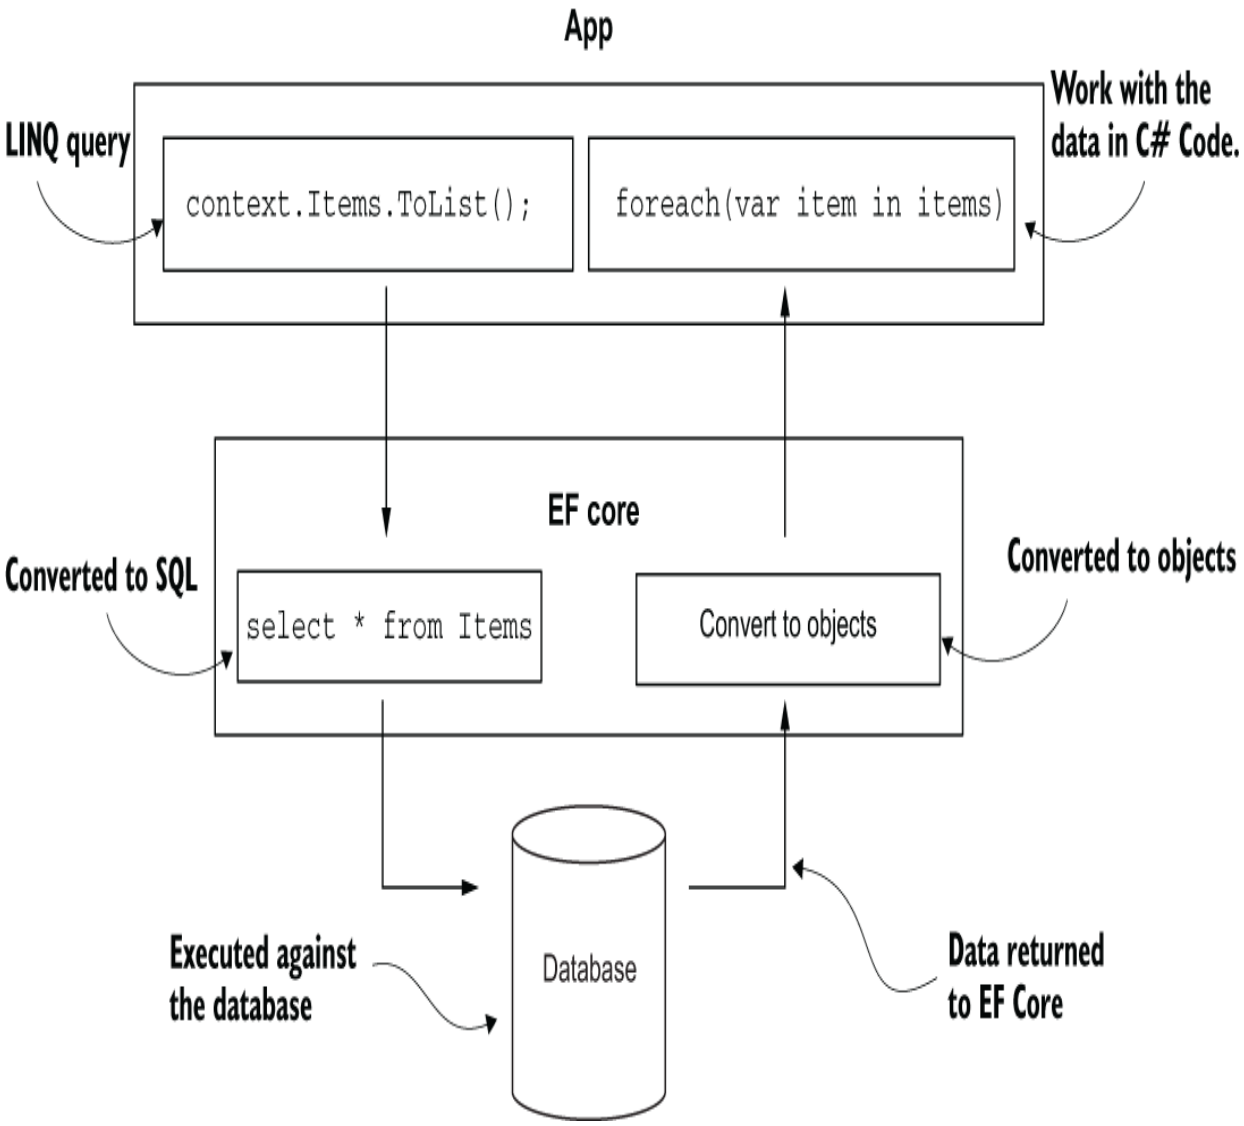

Figure 8.2 EF Core workflow, taking your LINQ query, converting it to SQL to execute against the database, and returning the results in a form
