the file open, add a new `PackageReference` entry to an existing `ItemGroup`, or create a new `ItemGroup` node:

```
<ItemGroup>
   <PackageReference Include="Microsoft.EntityFrameworkCore.Sqlite"
    ➥ Version="6.0.0" />
</ItemGroup>
```

Visual Studio users should notice that when you add a package this way, VS automatically runs the `restore` command and fetches the required libraries from NuGet. Using VS Code, you need to execute the `dotnet restore` command yourself from the terminal. The C# extension should prompt you to do this.

Alternatively, you can use the `dotnet add` command to add a package in VS Code. The command is:

```
dotnet add package Microsoft.EntityFrameworkCore.Sqlite
```

VS Code will automatically restore all packages after that command has been executed.

Visual Studio users have built-in tools for managing packages. Go to Tools > NuGet Package Manager, and from there, you can choose to Manage NuGet Packages for Solution. This brings up a dashboard UI that allows you to manage previously installed packages as well as search for and install additional ones. Or you can invoke the Package Manager Console (PMC) and execute commands for managing packages. To add a package, you use the `install-package` command:

```
install-package Microsoft.EntityFrameworkCore.Sqlite
```
