

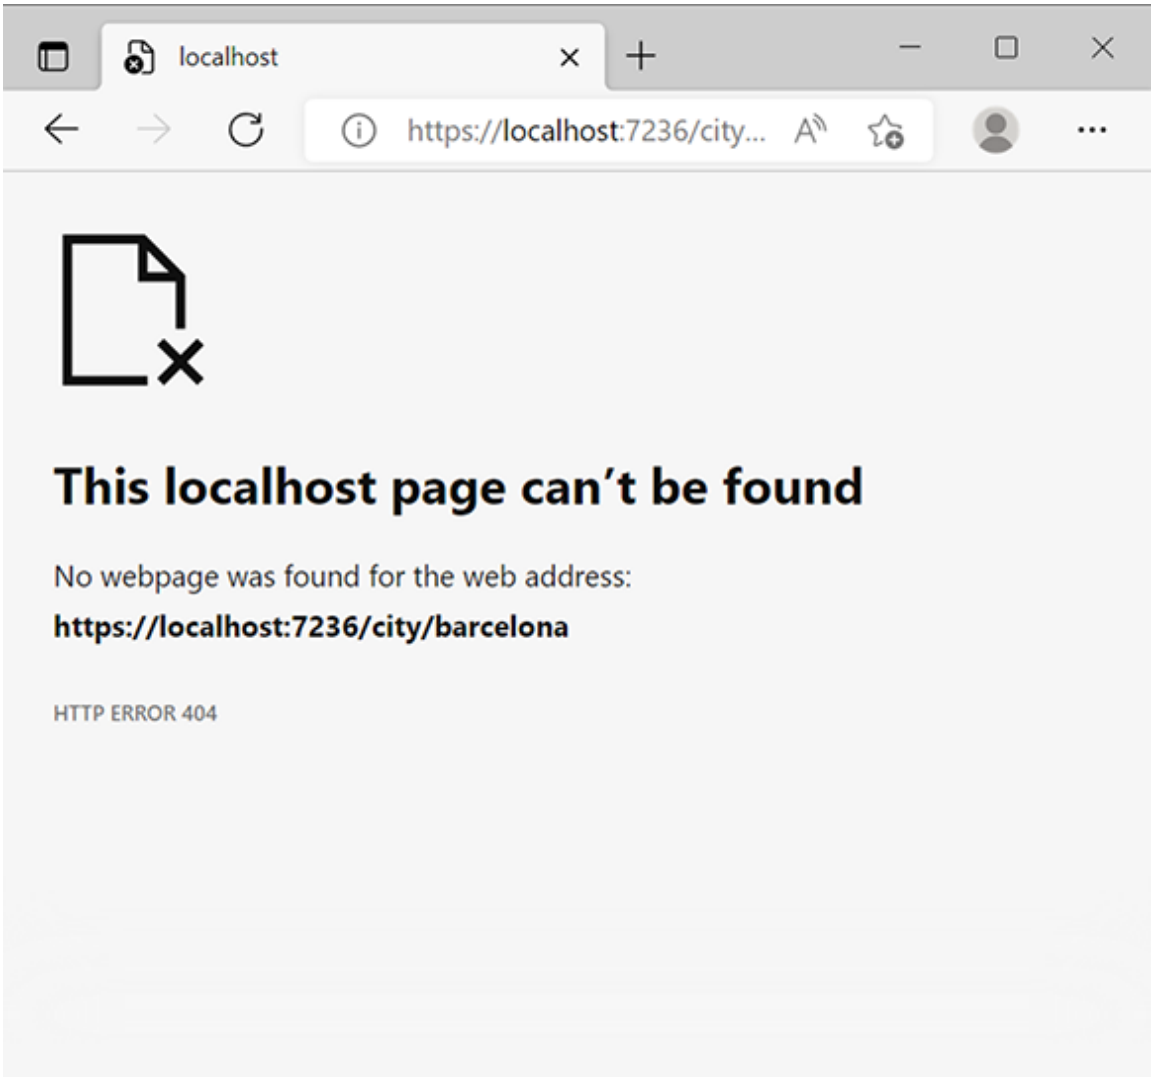

Figure 8.8 The City page returns a 404 Not Found.

Oh! What happened there? Well, chances are if you are using SQL Server instead of SQLite, you can see details of the selected city. The problem with SQLite is that, by default, string comparisons are case sensitive. You are passing a lowercase value from the URL to the service method, which compares it to a mixed case value in the database. To get around this, you can use the `EF.Functions.Collate` method to specify the collation SQLite should use for this comparison. `EF.Functions` contain a collection of useful methods that translate to database functions
