and only apply to LINQ queries used within EF Core. The documentation provides a comprehensive list of them (http://mng.bz/gRrv). Open up the `CityService`, and change the `GetByNameAsync` method as follows.

Listing 8.21 Specifying the collation to be used for the query

```
public async Task<City> GetByNameAsync(string name)
{
    name = name.Replace("-"," ");                                    ❶
    return await _context.Cities
        .Include(c => c.Country)
        .Include(c => c.Properties.Where(p =>
        ➥ p.AvailableFrom < DateTime.Now))
        .SingleOrDefaultAsync(c =>
        ➥ EF.Functions.Collate(c.Name, "NOCASE") == name);    ❷
}
```

❶ Replace the hyphens added by the page route parameter transformer with spaces, so they match database entries.

❷ Use EF.Functions.Collate to specify a collation of NOCASE for SQLite.

Once this correction is in place, you should be able to view details of your selected city (figure 8.9).
