

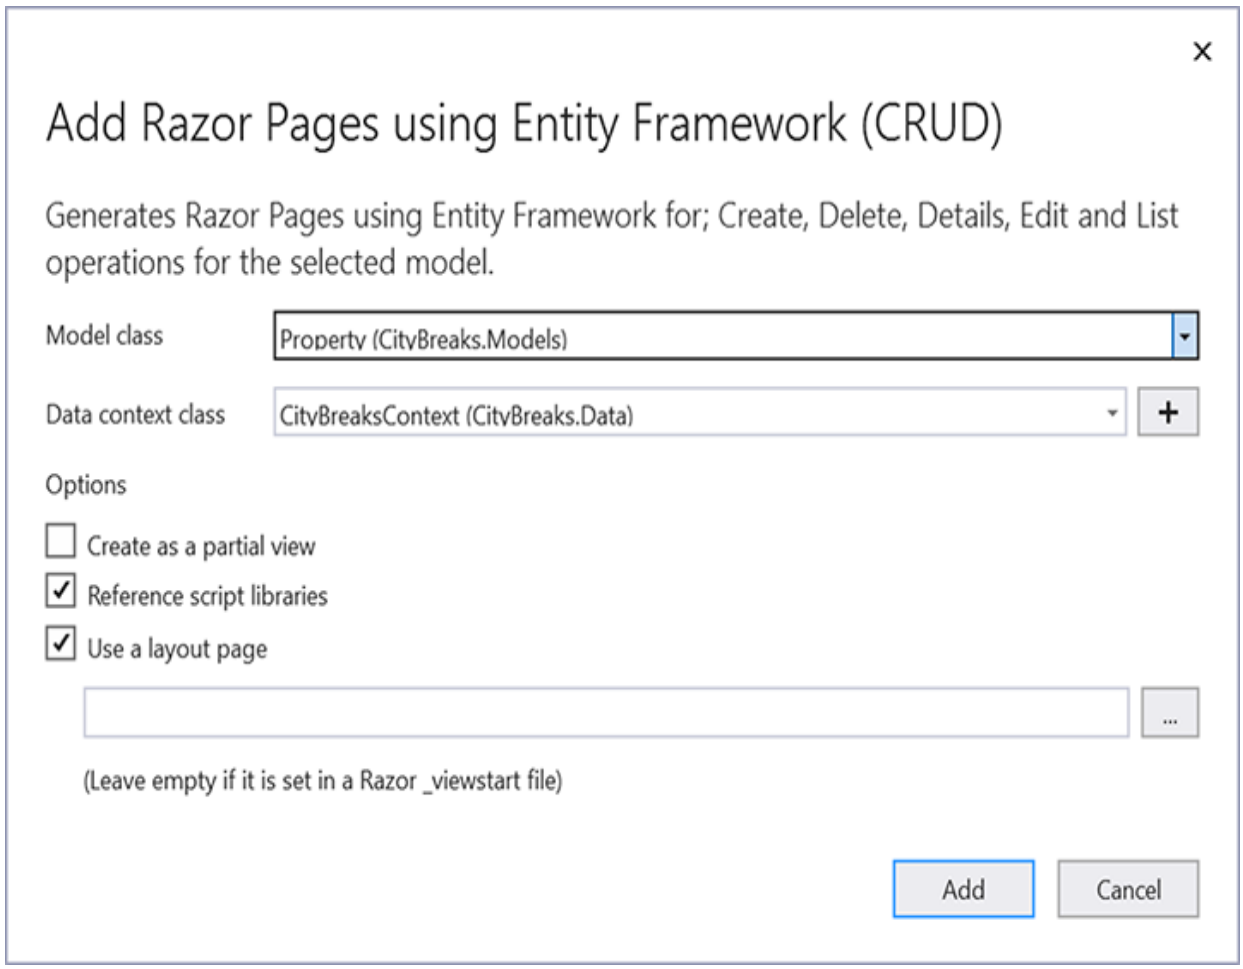

Figure 8.10 The scaffolding dialog in Visual Studio

Click the Add button. You will be prompted to replace the existing files related to the Create page. Click Yes. Then the code generator should run. You may find that the scaffolding tool adds a reference to the `Microsoft.EntityFrameworkCore.SqlServer` package. This is not needed for your application while using the SQLite database; only the scaffolding tools require it. Once you have completed scaffolding, you can remove this reference if you prefer. If you are working with SQL Server, this reference will already exist and is required by your application.

8.4.2 Scaffolding from the command line
