To scaffold items from the command line, you must install the `dotnet-aspnet-codegenerator` tool first. This is a global tool, similar to the `dotnet-ef` tool you installed earlier. The tool is installed using the following command:

```
dotnet tool install --global dotnet-aspnet-codegenerator
```

Once the tool is installed, you can use it. The command name is the same as the tool: `dotnet-aspnet-codegenerator`. The command requires the name of the generator you want to use, followed by the options you want to apply. The name of the Razor Pages generator is `razorpage`. The Razor Pages generator options are detailed in table 8.2.

Table 8.2 Razor Pages generator options
